

Risk tiers and required treatment

Classification follows effect and context, not reassuring tool names.

Tier	Effect class	Default treatment
0	Proven non-sensitive read; no egress or execution	Allow only with verified scope and coverage.
1	Bounded reversible local write	Allow or constrain within an approved isolated scope.
2	Executable, networked, supply-chain or meaningful state change	Sandbox, constrain or require approval.
3	Production, privileged, destructive, credentials or hard to reverse	One exact approval or denial; trust cannot weaken this.
