

Protocol admission and bounded execution

Limits apply to authenticated scopes and remain active during work.

Control	Scope / evidence	Failure response
Replay resistance	Session-bound request identifiers, nonces and timestamp skew	Reject replay before invocation.
Rate and concurrency	User, agent, client, session, route, server, destination and action	Deny admission at exhausted quotas.
Payload and recursion	Input/result bytes, depth, fan-out and cyclic ancestry	Stop oversized or recursive work.
Deadline and cancellation	Bounded time, abort propagation and runtime checkpoints	Cancel; persist safe outcome classification.
Dependency health	Identity, route, policy, database, parser and downstream	Fail closed; circuit breaker; no memory fallback.
