

# Local engineering completion and production assurance

Separate evidence questions prevent a misleading protection claim.

| Evidence boundary         | Recorded state                                    | What remains outside the claim                         |
|---------------------------|---------------------------------------------------|--------------------------------------------------------|
| Phase 2 implementation    | 21 locally complete feature records               | Independent production security review.                |
| Regression / workflows    | 295 unit; 66 integration; 4 browser (historical)  | Adaptive comparative security/utility experiments.     |
| Upstream interoperability | Two version-pinned locally launched servers       | Independently administered host operation.             |
| Local packaging           | Unsigned and unpublished non-production artifacts | Signing, publication and operational ownership.        |
| Deployment coverage       | UNPROTECTED; protected forwarding disabled        | Exclusive mediation and production credential custody. |
